Super Shuffle can be found online at: bjaubuchon.github.io/SuperShuffle

Super Shuffle was created using JavaScript, HTML, and CSS. The icons used are from FontAwesome, and the fonts used are Hooked Up 101, Eras Demi, and Saira.

If I chose to submit the project files to Canvas as well, just running the index.html file should work. It is intended to be a phone app though, so be sure to use the developer tools so you can get the intended experience.

For the parts of the app that are not actually functioning:

No music actually plays, so when you "play" a playlist it will simply bring you to a screen with the list of songs in the order specified, or a random order if shuffled. There is no way to create a new playlist, however you are able to modify the songs in the two existing playlists. You can not add songs either, so you will simply have to use the ten songs provided. You can modify the existing presets in Playlist 1, but you cannot add more. You can create one new preset in Playlist 2, but none after that. Additionally, I chose to use session storage rather than local storage, just in case there is a terrible bug that I missed. This way everything will be restored to default once the browser tab is closed and re-opened, however this also means that any changes made will be lost once the browser tab is closed. Other than that, the app should basically function as intended.

Instructions for using the app:

Clicking on the name of a playlist will show you all the songs in that playlist. You can click add songs to add songs to that playlist, or click on songs in the playlist to remove them. Removing a song from the playlist will also remove it from any presets for that playlist. You can edit a playlist's presets as well as see more options for playing by clicking the gear icon. Clicking the play buttons next to any of the presets, or pressing either "Play Shuffled" or "Play In-Order" will play the songs (as stated above, no music actually plays). You can edit the presets by clicking the gear icon on the preset. Clicking on "Add Songs" within a block will add songs to that block. Clicking on songs within a block will remove those songs from that block. Similarly, clicking "Add Blocks" at the bottom will allow you to add more blocks, and clicking on a block in the preset will remove the block from the preset.
